

How to use my custom checkstyle

Disclaimer: Admittedly this was harder than I thought it'd be but this should be a decent checkstyle that follows all of Liam's rules. The only thing that I 100% can't get working is it's check on constant variables – it flags weird errors that shouldn't exist. So please don't 100% rely on the checkstyle working, but it should act as a decent guide. This guide only works for eclipse.

- 1) To download checkstyle onto your eclipse - <https://www.youtube.com/watch?v=93OXYCdRhE> (good video)
- 2) After activating checkstyle (which can be seen in the video) do this:

Check Configuration Properties

Check Configuration

Create a new Check Configuration

Type: External Configuration File

Name:

Location: Browse...

Description:

Advanced options

☐ Protect Checkstyle configuration file

Additional properties... ? OK Cancel

Check Configuration Properties

Check Configuration

Create a new Check Configuration

Type: External Configuration File

Name: New group 9 check

Location: C:\Users\caisi\Desktop\Group checkstyle\Group9 check Browse...

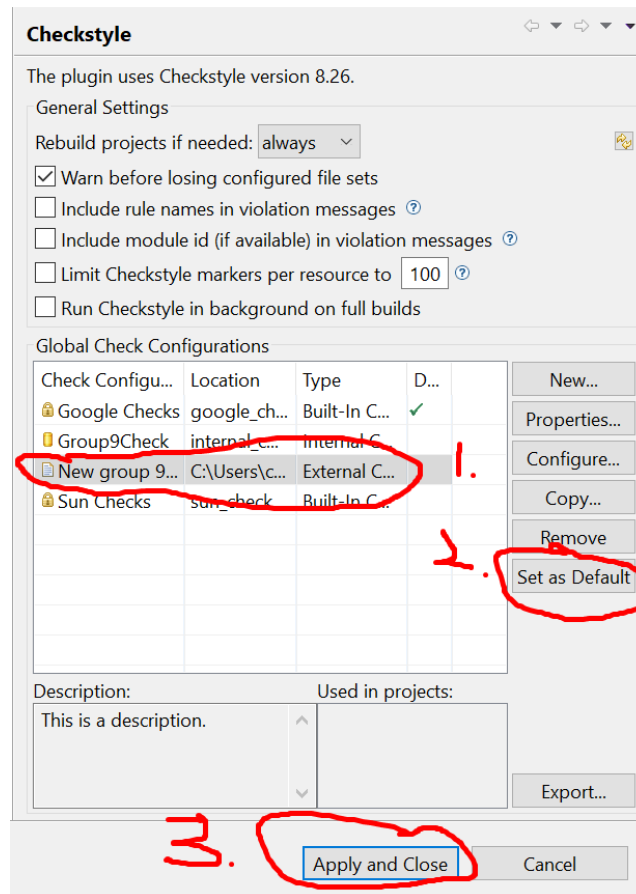

Description: This is a description.

Advanced options

☐ Protect Checkstyle configuration file

Additional properties... ? OK Cancel

1. Make sure you've selected "External Configuration File" from dropdown list, and name is what you like
2. Use browse to find where you've downloaded the folder and select the "Group9 check file"
3. Give it a description (doesn't matter what you put)
4. Press ok

- 1) Select the checkstyle
- 2) Set is as default
- 3) Apply and close

This should then work when you do this:

To get rid of errors, hover over the yellow highlighted areas, fix whatever it's telling you to and then ctrl + s the project (sorry IOS users, don't know what your save shortcut is), and it should disappear if you've fixed it and are now conforming to coding standards.

Let me know of any issues.
